

EVENTFORCE MANAGEMENT SYSTEM

Salesforce CRM Implementation

1. Project Overview

The EventForce Management System is a Salesforce-based Customer Relationship Management (CRM) solution designed to digitize and streamline event management operations. The system provides a centralized platform for managing events, clients, vendors, venues, and feedback.

The system addresses important event-management activities such as client booking, venue reservation, vendor coordination, event scheduling, cancellation approval, client communication, and feedback collection.

The solution uses Salesforce custom objects and relationships to organize business data. The major custom objects are Event, Client, Vendor, Venue, Feedback, and Event Vendor, where the Event Vendor object functions as a junction object to establish a many-to-many relationship between Events and Vendors.

The system also incorporates Salesforce automation and configuration features such as Flows, Validation Rules, Formula Fields, Approval Processes, Profiles, Roles, Permission Sets, Sharing Rules, Reports, and Dashboards. These features provide automation, data accuracy, controlled access, and real-time visibility into event operations.

The EventForce system is intended to reduce manual work, improve booking efficiency, support better coordination between stakeholders, and provide data-driven insights through Salesforce reports and dashboards.

Main Modules

- **Event Management** – Manage event details, dates, types, status, venues, clients, and budgets.
- **Client Management** – Store client contact and location information.
- **Vendor Management** – Maintain vendor information, services, and availability status.
- **Venue Management** – Manage venue details, capacity, location, and availability.
- **Feedback Management** – Record client ratings and comments.
- **Vendor Assignment** – Connect events with multiple vendors through the Event Vendor junction object.
- **Automation** – Automate reminders, approvals, notifications, and event-related processes.
- **Reporting and Analytics** – Monitor upcoming events, vendor performance, and client feedback.

2. Objectives

The primary objective of EventForce is to create a centralized CRM platform that simplifies and automates event-planning operations.

Main Objectives

1. Centralize Event Information

Maintain event, client, vendor, venue, and feedback information within a single Salesforce platform.

2. Improve Event Management

Provide an organized system for scheduling and tracking events from planning through completion.

3. Streamline Client Management

Maintain client contact information and connect clients with their respective events.

4. Improve Vendor Coordination

Manage vendor information and assign multiple vendors to events using the Event Vendor junction object.

5. Manage Venue Reservations

Maintain venue availability and reservation information while supporting mechanisms to prevent double bookings.

6. Automate Business Processes

Use Salesforce Flows, Approval Processes, Apex logic, and email notifications to reduce repetitive manual activities.

7. Improve Data Accuracy

Use Validation Rules and Formula Fields to ensure reliable data entry and automated calculations.

8. Implement Controlled Data Access

Use Profiles, Roles, Permission Sets, Organization-Wide Defaults, and Sharing Rules to control access to records.

9. Provide Business Insights

Use Reports and Dashboards to visualize upcoming events, vendor performance, and client feedback.

10. Improve Business Efficiency

The project documentation identifies expected business value including reduction of manual processes and improved booking efficiency through centralized automation and reporting.

Phase 1 – Requirement Analysis and Planning

The first phase focused on understanding the business requirements and designing the Salesforce solution.

The EventForce system was planned around the requirements of event coordinators, clients, vendors, venue managers, and administrators.

Functional Requirements

The system was designed to provide:

- Event creation and management.
- Client information management.
- Vendor information and service management.
- Venue reservation management.
- Feedback collection.
- Event-vendor assignment.
- Automated client reminders.
- Event cancellation approval.
- Data validation.
- User access control.
- Reports and dashboards.

Salesforce Data Model

The following custom objects were identified:

Object	Purpose
Event	Stores event details
Client	Stores client information
Vendor	Stores vendor information
Venue	Stores venue information
Feedback	Stores event feedback

Event Vendor Connects Events and Vendors

The relationships include Lookup relationships between Event and Client, Event and Venue, Feedback and Event, and Feedback and Client. The Event Vendor junction object uses Master-Detail relationships with Event and Vendor to support the many-to-many Event–Vendor relationship.

The screenshot shows the Salesforce Object Manager interface. The browser address bar displays the URL: orgfarm-5bc4e2475a-dev-ed.develop.my.salesforce-setup.com/lightning/setup/ObjectManager/home. The page header includes the Salesforce logo, a search bar, and navigation links for Setup, Home, and Object Manager. The main content area is titled 'Object Manager' and shows a list of 106+ items, sorted by label. The list includes the following objects:

Object Name	API Name	Object Type	Created Date	Status	Actions
Engagement Channel Type	EngagementChannelType	Standard Object			
Engagement Channel Work Type	EngagementChannelWorkType	Standard Object			
Entitlement	Entitlement	Standard Object			
Entitlement Contact	EntitlementContact	Standard Object			
Event	Event__c	Custom Object	9/30/2026	✓	▼
Event	Event	Standard Object			
Event Vendor	Event_Vendor__c	Custom Object	9/28/2026	✓	▼
Feedback	Feedback__c	Custom Object	9/28/2026	✓	▼
Finance Balance Snapshot	FinanceBalanceSnapshot	Standard Object			
Finance Transaction	FinanceTransaction	Standard Object			
Fulfillment Order	FulfillmentOrder	Standard Object			

Stakeholders

The major stakeholders identified were:

- Clients
- Event Coordinators
- Vendors
- Venue Managers
- Event Administrators

The requirements and execution roadmap were used as the foundation for the remaining implementation phases.

PHASE 2 – BACKEND DEVELOPMENT AND CONFIGURATIONS

Phase 2 focused on building the core Salesforce functionality and automation backbone.

The backend configuration included custom objects, fields, relationships, validation rules, formula fields, Flows, Approval Processes, Apex logic, and security configuration.

Custom Objects

The system contains:

- Event
- Client
- Vendor
- Venue
- Feedback
- Event Vendor

Important Fields

The Event object includes fields such as:

- Event Name
- Event Date
- Event Type
- Event Status
- Event Budget
- Client
- Venue

The Event Type includes values such as Wedding, Corporate, Birthday, Anniversary, Festival, Concert, and Other.

The Event Status includes:

- Planned
- Confirmed
- Completed
- Pending Cancellation
- Canceled
- Rejected

Formula Field

The Event Budget is implemented as a Formula Field with different predefined budget values based on the selected Event Type.

Validation Rule

A validation rule named Email_Valid_Address was created for the Client object. It checks whether the entered email follows the required email format and displays an error message when an invalid email address is entered.

The screenshot displays the Salesforce Setup interface for a validation rule. The breadcrumb trail shows 'SETUP > OBJECT MANAGER' and the object 'Client'. The left sidebar lists various setup options, with 'Details' selected. The main content area is titled 'Client Validation Rule' and includes a 'Back to Client' link. Below this, the 'Validation Rule Detail' section shows the rule's configuration:

Validation Rule Detail		Active
Rule Name	Email_Valid_Address	✓
Error Condition Formula	NOT(REGEX(Email_c, "[a-zA-Z0-9_]+@[a-zA-Z0-9]+\.[a-zA-Z]{2,5}"))	
Error Message	Please Enter Valid Email Address	Error Location Email
Description		
Created By	Sahana.S. 9/28/2026, 11:42 PM	Modified By Sahana.S. 9/28/2026, 11:42 PM

Buttons for 'Edit' and 'Clone' are available for the rule name, error message, and the bottom row of the configuration table.

Approval Process

An Event Cancellation Approval Process was implemented.

The process is triggered when the Event Status becomes Pending Cancellation. The request is sent for approval and email notifications are generated. Depending on the approval result:

- Approved → Event Status becomes Canceled.
- Rejected → Event Status becomes Rejected.

The approval process also includes notification emails to relevant users.

Automation Flows

A major automation is the 3-Day Reminder Flow.

When an event is confirmed and has a valid client email address, the system is designed to send a reminder to the client three days before the Event Date.

Apex Classes and Triggers were also used for advanced business logic such as venue availability updates and preventing double bookings.

PHASE 3 – UI/UX DEVELOPMENT AND CUSTOMIZATION

Phase 3 focused on creating a simple and user-friendly Salesforce interface for EventForce.

A custom Lightning App was created to provide centralized access to the major modules of the system.

The application provides access to:

- Events
- Clients
- Vendors
- Venues
- Feedback
- Reports
- Dashboards

This allows users to access the major EventForce functions from a single Salesforce workspace.

Reports

Reports were created to provide useful information for event management and decision-making.

Examples include:

- Upcoming Events by Month
- Event summary
- Vendor performance
- Client feedback

Dashboard

The EventForce Operations Dashboard provides a visual summary of important event-management information. The project includes an Upcoming Events by Month report as a dashboard component for monitoring upcoming events.

The UI customization therefore combines navigation, data management, reporting, and dashboard visualization into a single Salesforce Lightning experience.

PHASE 4 – DATA MIGRATION, TESTING AND SECURITY

Phase 4 focused on preparing the EventForce system for reliable and secure operation.

Data Migration

Validated records for the following objects were imported into Salesforce:

- Events
- Clients
- Vendors
- Venues
- Feedback

The Data Import Wizard was used after pre-validation checks to reduce duplicate records and maintain data consistency.

User and Role Configuration

User accounts were configured for different business responsibilities, including:

- Event Administrator
- Event Coordinator
- Vendor Manager
- Client

Profiles and Roles were assigned according to the responsibilities and access requirements of each user type.

Security Configuration

The security model includes:

- Profiles
- Role Hierarchy
- Permission Sets
- Sharing Rules
- Organization-Wide Defaults (OWD)

The Event object's Organization-Wide Default was configured as Private, providing controlled access to event records.

A sharing rule named Event_Sharing_For_Vendors was also configured to provide appropriate read-only access to the Vendor Manager role.

Testing

Testing was performed to verify:

- Data accuracy.

- Automation behavior.
- User permissions.
- Validation rules.
- Approval process behavior.
- Overall system functionality.

This phase ensured that the EventForce system was prepared as a secure and functional CRM solution.

PHASE 5 – DEPLOYMENT, MAINTENANCE AND DOCUMENTATION

Deployment Strategy

The EventForce Management System was developed and tested within a Salesforce **Developer Edition Org**.

The project did not perform an actual production deployment because the Developer Edition environment used for the project is a standalone environment and is not connected to a production instance.

The deployment strategy therefore focused on preparing the Salesforce configuration and metadata for a future deployment.

The deployment preparation includes:

- Custom objects and fields.
- Relationships.
- Flows.
- Apex components.
- Approval Processes.
- Security configurations.
- Reports.
- Dashboards.

For a real-world Salesforce implementation, deployment can use appropriate sandbox environments and deployment tools such as Change Sets, Salesforce DX, or CI/CD-based Salesforce development processes.

\Maintenance and Monitoring

Maintenance ensures that the EventForce system continues to operate correctly after implementation.

Regular monitoring includes:

- Salesforce Flows.
- Apex jobs.
- Approval Processes.
- Event records.
- Client records.
- Vendor records.
- Venue information.
- Feedback records.

Troubleshooting activities include:

- Resolving user-access and permission conflicts.
- Debugging Apex Triggers.
- Debugging Flow logic.
- Updating Validation Rules when business requirements change.
- Adjusting Sharing Rules when access requirements change.
- Maintaining accurate and updated business data.

These activities support the long-term stability and scalability of the EventForce system.

4.3 Project Documentation

The documentation provides a complete record of the EventForce implementation.

It covers:

- Project objectives.
- Requirement analysis.
- Salesforce data model.
- Object and field configuration.
- Relationships.
- Automation components.
- Validation Rules.
- Approval Process.
- Apex logic.
- Security model.
- Testing activities.
- Reports and Dashboards.
- Implementation screenshots.

The documentation acts as a reference for future developers and administrators and supports future maintenance, training, scalability, and knowledge transfer.

Conclusion

The EventForce Management System demonstrates the implementation of a Salesforce-based CRM solution for managing event-planning operations.

The project successfully brings together custom objects, relationships, automation, validation, approval workflows, security controls, reports, and dashboards into a centralized system.

The implementation provided practical understanding of:

- Salesforce data modeling.

- Custom object and field creation.
- Lookup and Master-Detail relationships.
- Junction objects for many-to-many relationships.
- Salesforce Flows.
- Validation Rules.
- Formula Fields.
- Approval Processes.
- Profiles, Roles, Permission Sets, and Sharing Rules.
- Data migration and testing.
- Reports and Dashboards.
- Salesforce deployment preparation and maintenance.

The project demonstrates how Salesforce functionality can be configured to support event scheduling, client management, vendor coordination, venue management, cancellation workflows, feedback collection, and business reporting.

Although the implementation was completed in a Developer Edition environment for academic purposes, the project follows the structure of a real-world CRM implementation and provides a foundation for future deployment, maintenance, and scalability.

}  
  
}  
  
}
```

The screenshot displays the Salesforce Developer Console interface. The main editor shows the Apex class `BatchCompleteEvents` which implements `Database.Batchable<Object>`. The class contains three methods: `start`, `execute`, and `finish`. The `start` method returns a query locator for events that are not completed and occurred before today. The `execute` method iterates over the event records and updates their status to 'Completed'. The `finish` method logs a debug message. Below the code editor, the 'Logs' tab is active, showing a table with columns for User, Application, Operation, Time, Status, Read, and Size. The Windows taskbar at the bottom shows the system clock as 9:01 AM on 10/2/2026.

```
1 global class BatchCompleteEvents implements Database.Batchable<Object> {  
2  
3     global Database.QueryLocator start(Database.BatchableContext bc) {  
4         return Database.getQueryLocator(  
5             'SELECT Id, Event_Date__c, Event_Status__c FROM Event__c WHERE Event_Date__c < TODAY AND Event_Status__c != \'Completed\''  
6         );  
7     }  
8  
9     global void execute(Database.BatchableContext bc, List<Event__c> scope) {  
10         for (Event__c ev : scope) {  
11             ev.Event_Status__c = 'Completed';  
12         }  
13         update scope;  
14     }  
15  
16     global void finish(Database.BatchableContext bc) {  
17         System.debug('Past events marked as Completed');  
18     }  
19 }
```
